Topic

An Analysis of Gender Bias and Financial Myths in Hollywood Movies

Summary

Movies are very important for our culture, but they often do not reflect the real world. Gender inequality in Hollywood is a big problem. It is not just about the number of actresses. It is about money, directors, and the stories they choose to tell. In this project, I want to understand this problem better by separating myths from reality.

My main goal is to analyze gender bias using the Bechdel Test data from 1970 to 2013. The Bechdel Test is a simple rule to measure the representation of women in fiction. For a movie to pass this test, it must meet three simple criteria:

- 1-It must have at least two women.
- 2-These women must talk to each other.
- 3-They must talk about something other than a man.

It sounds simple, but many famous movies fail this test. I will dig deeper into three main areas to understand why. First, I will analyze the “Budget Gap”. I want to know if Hollywood gives more money to movies about men. My guess is that male-dominated movies get much higher budgets. Second, I will look at “Directors”. I want to see if famous directors like Spielberg or Nolan make movies that include women, or if they ignore them. Finally, I will study the “Reasons for Failure”. Do movies fail because there are no women, or because the women only talk about men?

My goal is to turn these numbers and data into visuals that tell a story that everyone can understand.

Dataset Description

Dataset Name: Bechdel Test Movie Dataset

Description: This dataset contains information on 1,794 movies released between 1970 and 2013. The data includes financial details (Budget and Revenue), production details (Director and Year), and the Bechdel Test results (Pass or Fail).

Creators/Institution: The data was originally compiled by the news site FiveThirtyEight for their article about women in Hollywood. It was organized by the TidyTuesday community.

Source and Access Link: * FiveThirtyEight Original Article * TidyTuesday Data Repository
