I found this visualization example on the subreddit that is named r/dataisugly in Reddit. Here is the link : r/dataisugly

Data and Plot Description

This RB Insight highlights just how wide the age gap is between today's leading luxury brands. From heritage houses like Tiffany & Co., Louis Vuitton, and Hermès (founded in the 1800s) to contemporary disruptors like Jacquemus and Off-White, the timeline shows nearly two centuries of brand-building between the oldest and youngest names. Seeing them side by side makes it clear that "luxury" is now defined by both legacy and innovation, not age alone.

For founders and brand builders, the takeaway is simple: there is no single "right" age to be considered a serious player in fashion. Some of the most powerful luxury houses spent over 100 years compounding equity, while newer brands have leveraged new distribution, storytelling, and social dynamics to compress that timeline.

While you cannot fast-forward heritage, you can build relevance, positioning, and perceived value at any stage if the strategy is right. Source: RB Insights Age of Brands are based on 2026 calendar year, as 2025 nears its end.

Problems of the Graphic's

1. The colors are not meaningful. Colors does not give any information. The designer of this graph said that she used colors just for fun.
2. There is no X-axis. We only guess what is X-axis refers to, we can not say actually X-axis meaning to.
3. Lines on the plot are tiring on the eyes. So complex.

Solution Suggestion to Fix Problems on the Plot

We can explain the meaning of the Y-axis and the X-axis. Maybe, we can use informational colors like categorical colors by countries that brands founded at. Also, we can use timeline chart to get rid of complexity of lines.
