<https://datasciencejobposts2025.streamlit.app>

This dataset was created to analyze Data Science job postings in 2025. Collected from publicly available sources, it includes key attributes such as job titles, seniority levels, salaries, locations, industries, and required skills. Due to a high number of outliers, these observations were removed, and all analyses were conducted on the cleaned dataset. The resulting structured data provides insights into salary distributions, skill demand, and employment trends in Data Science roles, offering an overview of the 2025 job market.

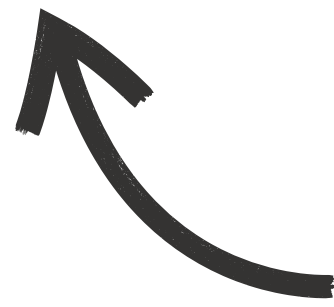

En Sık Görülen Beceri Üçlüleri (Top 10)

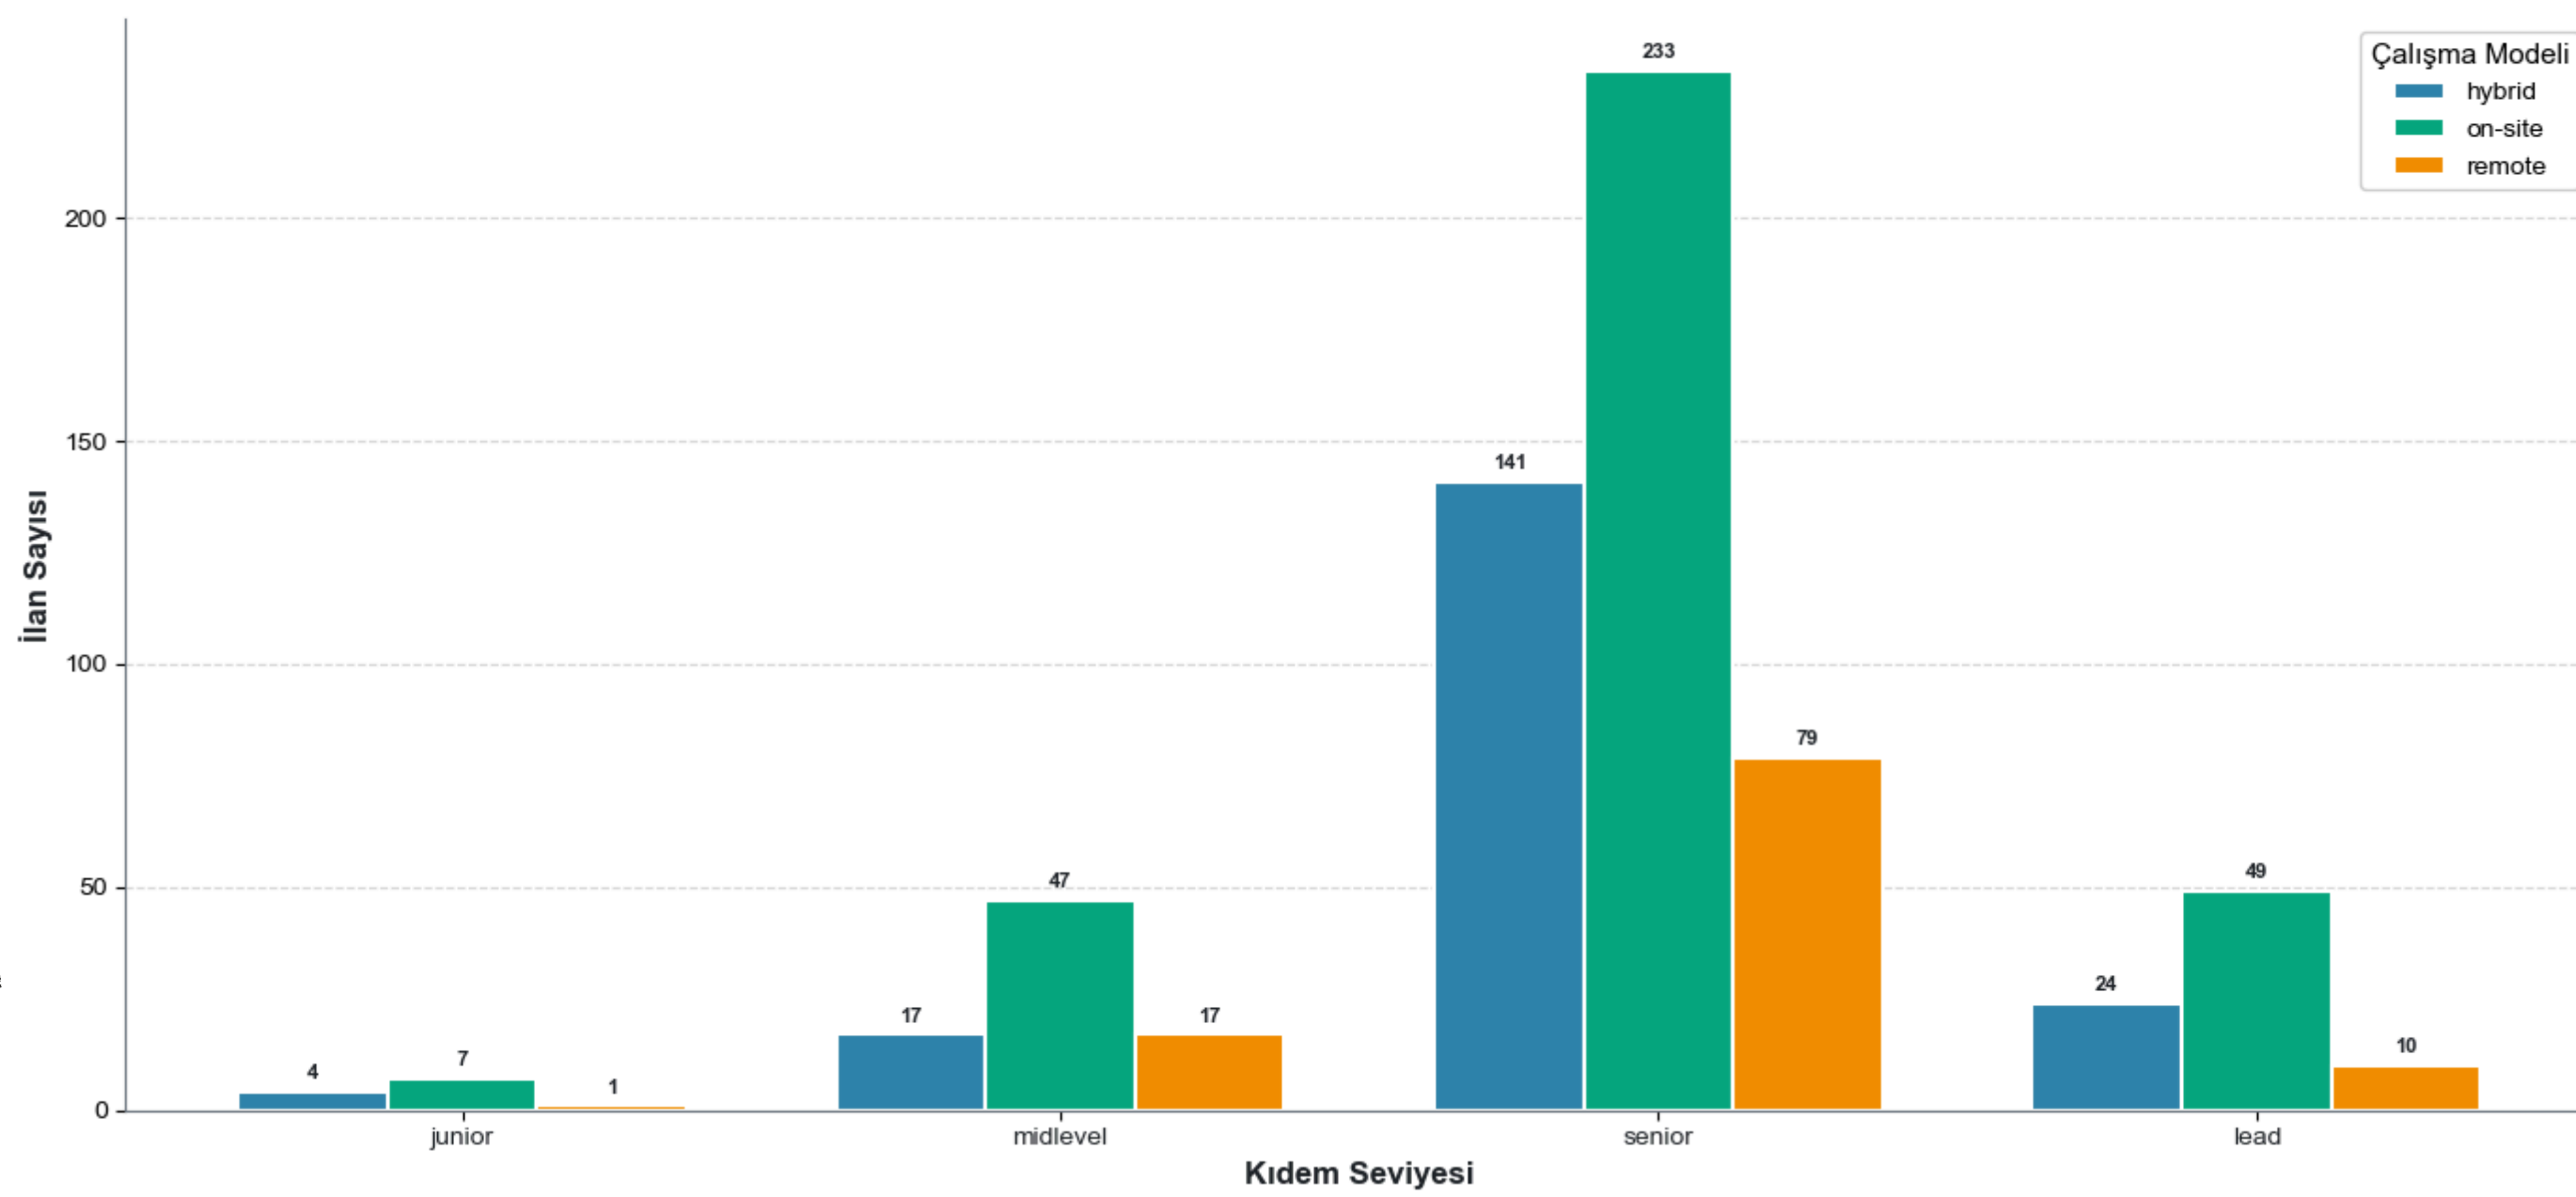

Data science job postings often emphasize combined skill sets rather than a single tool. The most common mixes pair Python with core data-handling tools like SQL (and sometimes R) plus machine learning / deep learning frameworks. This suggests candidates should build not only programming ability, but also data management and model development skills. In particular, the Python–SQL–Machine Learning trio stands out as a baseline requirement for many modern data science roles.

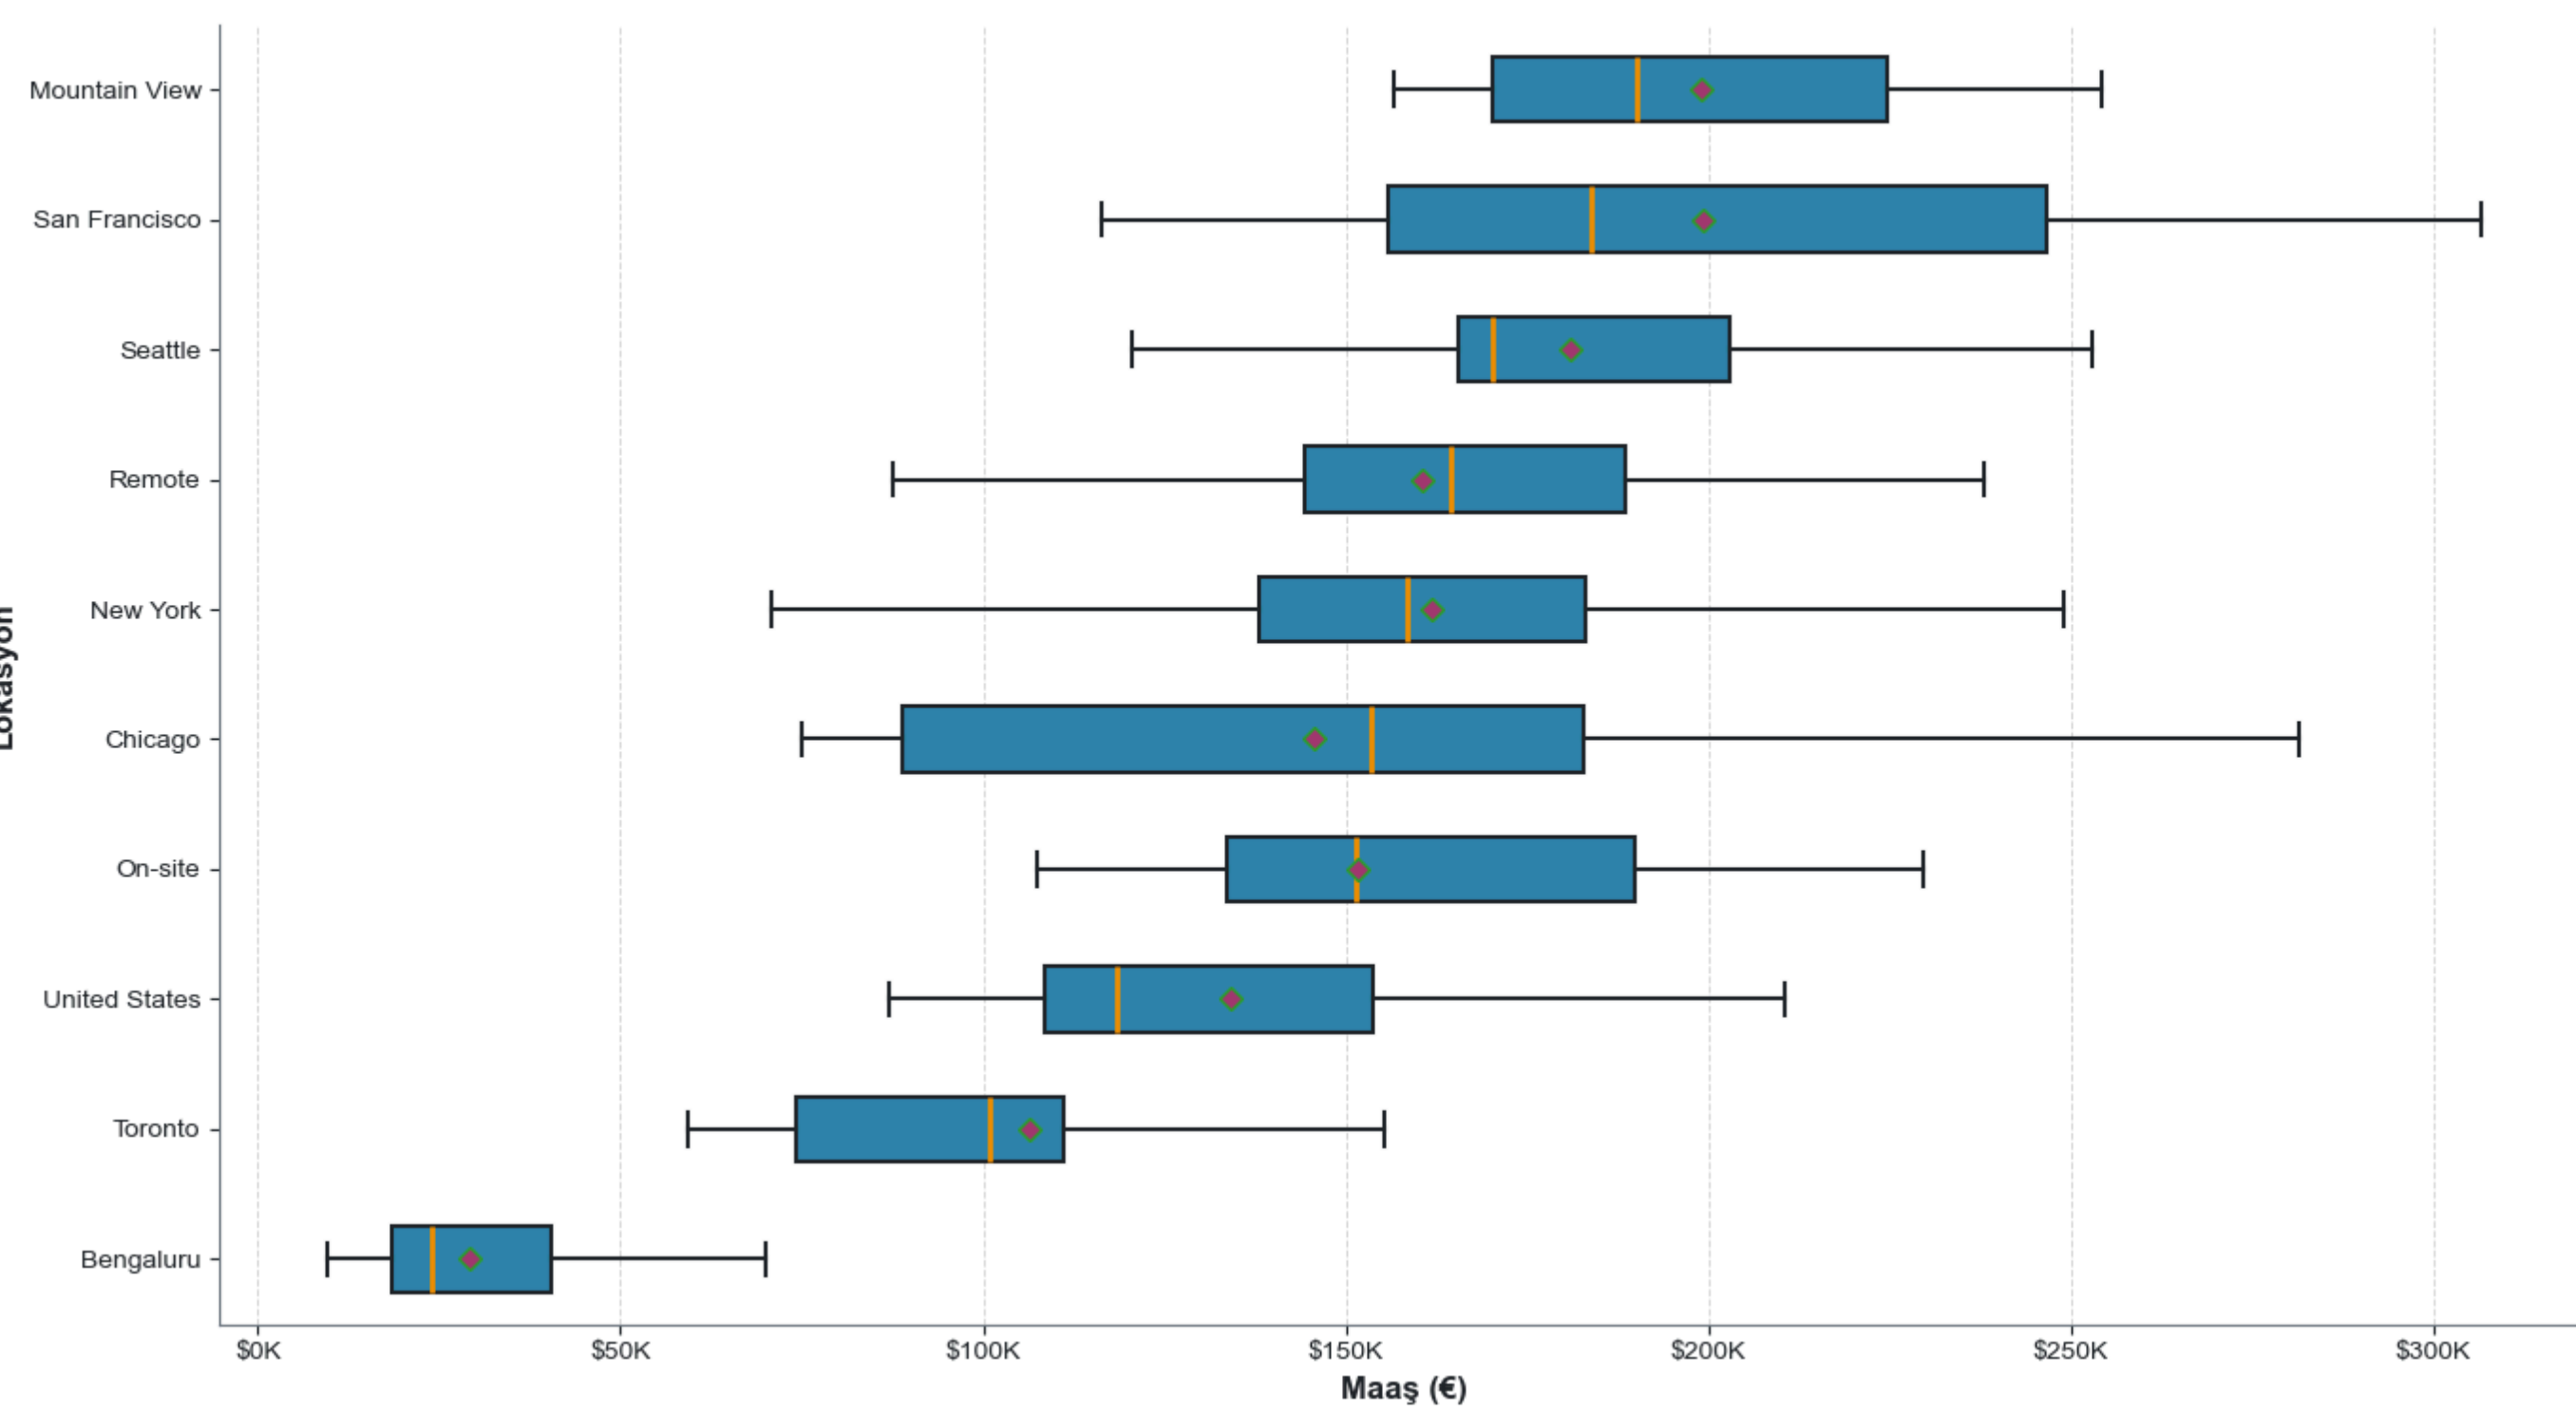

The visualization indicates that data science job postings are concentrated at the senior level and are most frequently offered as on-site roles, while hybrid opportunities follow and remote positions remain comparatively limited; overall, this suggests that as seniority increases, employers tend to prioritize workplace presence and structured collaboration, making senior–on-site/hybrid the dominant pattern in the dataset.

Kıdem Seviyesi ve Çalışma Modeli İlişkisi

Lokasyona Göre Maaş Dağılımı (Box Plot - Top 10 Şehir)

The box plot highlights how salary levels vary by location and shows that geography strongly influences earnings. Major tech hubs like San Francisco, New York, and Seattle stand out with noticeably higher typical salaries. Some locations also show a wider spread, suggesting greater variation in pay. Remote roles tend to have a broad salary range, reflecting the trade-off between accessing a global talent pool and keeping costs competitive. Overall, the visualization makes it clear that choosing where to work can significantly affect career income.
